

TURNING USED PLASTICS INTO NEW PRODUCTS?

THAT'S ADVANCED

The plastic waste problem is real. Fortunately, so is our solution. Advanced Recycling is a scientific and technological innovation.

Hard-to-recycle plastics are collected, sorted and removed of contaminants.

The plastics are broken down to **their building blocks** under exacting government oversight on air emissions.

These recycled materials can be remanufactured over and over into many different plastics and other products.

Use of recycled building blocks helps conserve resources and avoid greenhouse gas emissions.
